

THE LATE MINOAN IIIB:1 SETTLEMENT

STRATIGRAPHY AND CATALOGUES

STREET BETWEEN BUILDINGS 1 AND 3

STREET BETWEEN BUILDINGS 1 AND 3 (Figs. 51, 52a-b, Pls. 16c:19, 27, 21b:21, 25, 27, 54c-56a)

Between the Buildings 1 and 3 runs a street with a width of 1.1 (southwest) to 1.5 (northeast). This street, like the neighbouring buildings, seems to belong entirely within the LM IIIB:1 period and it has been heavily disturbed both during the Minoan and later periods for which reason only a few fragments of floors are preserved.

The street appears to have had three surfaces during its period of function. They were all sloping from east to west. In the eastern part only one floor level was noted, 13-Floor 5, which may also have coexisted with 13-Floor 2 when the western part of the street was raised. The original floor, 13-Floor 7a, was only noted in the western part. In the eastern part it had been cut through by rubbish pits upon which 13-Floor 5 was laid.

The upper surface of the street probably also functioned into the LM IIIB:2 period as indicated by deposits going down to the surface of the latest LM IIIB:1 street level, 13-Floor 2 in the western part.

In upper layer (Figs. 51, 52a-b, Pls. 54c-d, 55a)

This consisted of two fragments excavated in 1977 and 1982 respectively. The eastern fragment (13-Floor 5) excavated at levels 9.94 to 9.80, was yellowish-brown with a great concentration of pebbles and was rather soft, while in the western part, 13-Floor 2, excavated at levels from 9.91 to 9.75, the floor was more greyish. Several sherds and bones were noted in the floor and many small stones were found immediately below the floor. Below the floor was noted a thin layer of soft, yellowish-red, very sandy soil. LM IIIB and some LM IIIA was noted everywhere. 9.120 kg of pottery were collected: 21% decorated, 53% kept and 1.8% inventoried. Shapes were not counted.

In middle layer (Figs. 51, 52a-b, Pls. 55b)

Two deposits are described here: the floor with its possible packing, and a large rubbish area in the eastern part which had destroyed the lower street floor (13-Floor 7a) and therefore stratigraphically must be younger than that floor.

13-Floor 5, excavated at levels 9.83/9.74 to 9.72/9.58, is greyish with many small pebbles, sherds and bones trodden into the surface. In the northern part from 523.5 to c. 524.3 two slab stones were noted (Pl. 55b). Immediately below the surface it becomes red-brown, sandy with some bits of charcoal. Below the floor was a soft, sandy, light greyish-brown layer with a lot of ash in parts, bits of charcoal and small stones. This part of the street was only partly preserved from c. 522 to 524.3.

The rubbish pit was excavated as two different pits on each side of a Venetian wall that destroyed the pit, but soil descriptions, stratigraphical position, and levels (from below floor-packing to c. 9.24) strongly indicate that they were part of the same pit, for which reason they have here been treated as one. The very western part of this pit was destroyed by a Venetian pit (GSE I, 142-143), Fig. 52a. In the eastern part the soil is simply described as soft brown with a few small stones while in the western part (Pl. 21b:25) it is described as soft, yellowish-brown, sandy soil with some small stones and bits of charcoal. In the eastern part the rubbish pit extended both east and north of the preserved part of 13-Floor 5, but not below the walls. Neither did the western part of this deposit go below the walls of the street, although the bottom was found at a level which was little lower than the bottom of 13-Wall 2. In the very southwestern part a small hard deposit was noted at level 9.35, reminiscent of a street surface. The rubbish pit should probably be connected to the large Rubbish Area Southeast.

In and immediately below the floors LM IIIB was noted and some earlier sherds, while the rubbish pit below contained mainly LM IIIA and B with a few earlier pieces, while a few intrusive later sherds were also noted. 56.935 kg of pottery were collected: 19% decorated, 56% kept and 2.0% inventoried. Shapes were not counted.

BONES

84 fragments identified from young and adult *Ovis*, *Capra*, *Ovis/Capra*, *Sus*, *Bos*, and *Dama*; further from adult *Cervus* and 1 *ulna* supposedly from adult *Bos primigenius*.

SHELLS

3 *Spondylus* – upper, L 0.078, W 0.066, hinge 0.037, fresh, has spines; (2 among bones). 1 *Glycymeris* – left, very water-worn, W 0.049, H 0.045, hole W 0.008, H 0.005. 1 *Pinna* – frg., 0.063 × 0.0355.

Fig. 52b. Street, section B-B; cf. Fig. 51.

Comments: The two intrusive sherds derive from an area where the Turkish Pits 2-4 (*GSE I*, 105-109) had probably not been cleaned well enough. Most joins here can be naturally explained by later activities.

In lower layer (*Figs. 51, 52a-b, Pls. 16c:27, 55c-e, 56a*)

13-Floor 7a was identified in the western part of the street up to c. 524.2, east and northwest of which the rubbish pit had cut through the floor. The surface of the floor is grey, beaten earth floor containing sherds, bones, charcoal and many small pebbles; very sandy. The floor is 0.03-0.06 thick and sloping from east to west. It was excavated at levels 9.72/9.58 to 9.45/9.44. Below the floor was light brown to grey and red-brown soil, and it was found only in the western part below the floor up to 522.3, while in the eastern part we had a continuation of the pit which cut the original floor. In the floor both LM IIIA and B were noted with a few earlier pieces, while below the floor mainly LM IIIA was noted. 7.200 kg of pottery were collected: 13% decorated, 73% kept and 1.4% inventoried. Shapes were not counted.

BONES

Few fragments from adult *Ovis*, *Capra*, *Ovis/Capra*, and *Sus*.

SHELLS

1 *Glycymeris* – water-worn, small.

Comments: The sherds in and below this floor seem to indicate that the original street level like the neighbouring walls must have been constructed at the very beginning of IIIB:1.
